Art Unit: 2302

Part III DETAILED ACTION

1. Claims 1-53 are presented for examination.

A shortened statutory period for response to this action is set to expire three (3) months from the 2.

date of mailing of this communication. Failure to respond within the period for response will cause the

application to become abandoned. (35 U.S.C. § 133). Extensions of time may be obtained under the

provisions of 37 CFR 1.136(a).

Information Disclosure Statement

In view of the extremely large number of references submitted by the Applicant(s) for 3.

consideration of this application, the Applicant(s) are requested to identify any references which have

particular significance in the prosecution of this application for further consideration by the Examiner.

Applicant(s) should also indicate the specific features, corresponding passages, and figures of such

references which are believed to be germane to the invention claimed in the application

Specification

4. The title of the invention is not descriptive. A new title is required that is clearly indicative of the

invention to which the claims are directed.

5.

The lengthy specification has not been checked to the extent necessary to determine the presence

of all possible minor errors. Applicant's cooperation is requested in correcting any errors of which

applicant may become aware in the specification.

Art Unit: 2302

Claim Rejections - 35 USC § 103

6. The following is a quotation of 35 U.S.C. § 103 which forms the basis for all obviousness rejections set forth in this Office action:

A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Subject matter developed by another person, which qualifies as prior art only under subsection (f) or (g) of section 102 of this title, shall not preclude patentability under this section where the subject matter and the claimed invention were, at the time the invention was made, owned by the same person or subject to an obligation of assignment to the same person.

7. Claims 1-4 are rejected under 35 U.S.C. § 103 as being unpatentable over Civanlar, et al., (US 5,581,552) in view of Morgan, et al., (US 5,524,254). The claimed invention found within Claim 1 consists of a method for establishing point-to-point Internet communications comprising (a) storing in a database a set of IP addresses for on-line nodes, (b) transmitting a query from a node to a server to determine the status of a second node, and ® retrieving the IP address of the second node from the database in to establish communication between the two nodes. Civanlar, et al., in 2-3, teaches a multimedia server which uses a communication protocol in which the requesting node sends a request for communication with another node through a address server, which contains an address database, to obtain the address and routing information necessary to complete the communication. Civanlar, et al., is silent regarding the database searching to match the address with the destination node. Morgan, et al, in columns in columns 3-4, teaches the look-up procedure into the database which is performed to retrieve the matching address from the database for use in initiating communications over an network.

Art Unit: 2302

It would have been obvious to one of ordinary in the art at the time the claimed invention was made to

include an database and search/retrieval mechanism to locate the needed network address because such

a mechanism permits the database to me modified over time to allow dynamic address assignment thus

reducing the need to larger address identifiers and thus the amount of data that needs to be transmitted

with each packet of data.

Regarding Claim 2, the claimed invention adds the further limitation to the invention found within

Claim 1 that steps of obtaining the on-line status and IP address of the second node include the steps of:

(b1) sending a query to a server, (c1) searching the server's database, (c2) determining the on-line status

of the second node, (c3) retrieving the IP address of the second node, (c4) and transmitting the IP address

of the second node from the server to the requesting node. As was discussed above regarding Claim

1, Morgan, el al., in columns 3-4, teaches the look-up procedure into the database which is performed

to retrieve the matching address from the database for use in initiating communications over an network.

It would have been obvious to one of ordinary in the art at the time the claimed invention was made to

include an database and search/retrieval mechanism to locate the needed network address because such

a mechanism permits the database to me modified over time to allow dynamic address assignment thus

reducing the need to larger address identifiers and thus the amount of data that needs to be transmitted

with each packet of data.

Regarding Claim 3 and 4, the claimed invention in Claim 3 adds the further limitation to the

invention found within Claim 2 that the claimed process generate and transmit an error message which

is sent to the requesting node when the second node's status is off-line. The claimed invention Claim 4

adds the further limitation to the invention found within Claim 1 that secondary communications protocol

is used when a off-line status is found. Morgan, et al., in columns 13-14 teaches the process of handling

Art Unit: 2302

error condition where the requested second node is not available, that the processing terminates

gracefully. Implicit within this operation is the transmittal of appropriate messages to the requesting node

of this condition with the initiation of error recovery procedures...

8. Claims 5 and 12-16 are rejected under 35 U.S.C. 103 as being unpatentable over Civanlar, et al.

(US 5,581,552) in view of Morgan, et al., (US 5,524,254) as applied to claims 1-5 above, and further in

view of December, et al. (The World Wide Web Unleased). The claimed invention in Claim 5 adds the

further limitation to the invention found within Claim 4 that performing the secondary communication

protocol includes (d1) transmitting an e-mail signal over Internet from the first node with its IP address,

(d2) transmitting the message thru the Internet for delivery at the second node, and (d3) transmitting a

second IP address to the first node for establishing the point-to-point communications. The combination

of Civanlar, et al., and Morgan, et al. teaches the communications mechanism claimed here in utilizing

the address server and its database to initiate communications between the two nodes. Neither of these

two references teaches the message transport mechanism which is utilized to transmit the various

messages between the various processors on the network. December, et al., on pages 6-9 teaches the

various message and data types which are readily transported between two nodes attached to the Internet

and that each type of message is a format for which blocks of data are sent between different processors.

It would have been obvious to one of ordinary skill in the art at the time the claimed invention was made

to utilize Internet e-mail messages as the means to transport various requests between two processors

attached to the Internet because it is a well defined and well supported data transport means for moving

data between processors across the Internet and that the substitution of e-mail as the transport mechanism

Art Unit: 2302

Page 6

for any other message transport means would be within the ordinary skill of the art as these transport means are equivalent means for moving blocks of data between nodes of the network.

Regarding Claim 12, the claimed invention consists of an independent method claim for establishing point-to point communications comprising transmitting an e-mail signal from the first node via the Internet to the second node, each message containing the appropriate IP address to establish, and using these addresses to establish the point-to-point communication. The claimed invention is a simplified version of the method contained within Claim 1 above with the specification that the messages used to communicate between the first and second nodes be transported using e-mail. The combination of Civanlar, et al., and Morgan, et al. teaches the communications mechanism claimed here in utilizing the address server and its database to initiate communications between the two nodes. Neither of these two references teaches the message transport mechanism which is utilized to transmit the various messages between the various processors on the network. December, et al., on pages 6-9 teaches the various message and data types which are readily transported between two nodes attached to the Internet and that each type of message is a format for which blocks of data are sent between different processors. It would have been obvious to one of ordinary skill in the art at the time the claimed invention was made to utilize Internet e-mail messages as the means to transport various requests between two processors attached to the Internet because it is a well defined and well supported data transport means for moving data between processors across the Internet and that the substitution of e-mail as the transport mechanism for any other message transport means would be within the ordinary skill of the art as these transport means are equivalent means for moving blocks of data between nodes of the network.

Regarding Claim 13 and 14, the claimed invention adds the further limitation to the invention found within Claim 12 that the process of transmitting the appropriate email signal includes the first step

Art Unit: 2302

of generating the signal to be sent before it is transmitted. Implicit within the teaching of Cinvanlar, et al. Is the step of generating all messages that need top be transmitted to other processors before the message is transmitted using its particular transport means.

Page 7

Regarding Claim 15, the claimed invention adds the further limitation to the invention found within Claim 12 that processing the e-mail message for delivery thru the Internet consists of the processing the e-mail message using the e-mail server connected to the second processor. Implicit with the teachings of December, et al. is the existence of processes running at both nodes of the Internet that are communicating, which includes the e-mail function, to perform the steps necessary to allow the communication to occur. As such, the transmission of data between two nodes must include the use of a process like a mail server to operate at the receiving end of the communication in order for the communication to be successful. It would have been obvious to one of ordinary skill in the art at the time the claimed invention was made to utilize Internet e-mail messages on regularly supported e-mail servers as the means to transport various requests between two processors attached to the Internet because it is a well defined and well supported data transport means for moving data between processors across the Internet and that the substitution of e-mail as the transport mechanism for any other message transport means would be within the ordinary skill of the art as these transport means are equivalent means for moving blocks of data between nodes of the network.

Regarding Claim 16, the claimed invention adds the further limitation to the invention found within Claim 12 that step of processing the e-mail signal followed by transmitting a second IP address include the steps of generating a connection signal which is transmitted to the first node along with the second IP address. Civanlar, et al., in column 11, teaches the use of a signal to initiate the connection between the two nodes along with the all necessary address information needed by the nodes. December,

Art Unit: 2302

et al., teaches that the communication of these messages can be accomplished using e-mail over the

Page 8

Internet. It would have been obvious to one of ordinary skill in the art at the time the claimed invention

was made to utilize Internet e-mail messages as the means to transport various requests between two

processors attached to the Internet because it is a well defined and well supported data transport means

for moving data between processors across the Internet and that the substitution of e-mail as the transport

mechanism for any other message transport means would be within the ordinary skill of the art as these

transport means are equivalent means for moving blocks of data between nodes of the network.

9. Claim 6, which teaches an apparatus claims, fail to teach or define above or beyond Claims 1-5

above and are rejected for the same reasons set forth above in the rejections of Claims 1-5, supra.

10. Claims 7-11, which also teaches a set of apparatus claims, fail to teach or define above or beyond

Claims 1-5 above and are rejected for the same reasons set forth above in the rejections of Claims 1-5,

supra.

11. Claims 17-18, which teaches a set of apparatus claims, fail to teach or define above or beyond the

apparatus found within Claims 12-16 above and are rejected for the same reasons set forth above in the

rejections of Claims 12-16, supra.

12. Claims 19-20, which also teaches a set of apparatus claims, fail to teach or define above or

beyond the apparatus found within Claims 12-16 above and are rejected for the same reasons set forth

above in the rejections of Claims 12-16, supra.

Art Unit: 2302

13. Claim 21, which teaches a computer program product claim, fail to teach or define above or

Page 9

beyond Claims 1-5 above and are rejected for the same reasons set forth above in the rejections of Claims

1-5, supra.

14. Claim 22, which teaches a computer program product claim, fail to teach or define above or

beyond Claims 12-16 above and are rejected for the same reasons set forth above in the rejections of

Claims 12-16, supra.

15. Claims 23-25, which also teaches a set of apparatus claims, fail to teach or define above or

beyond Claims 1-5 above and are rejected for the same reasons set forth above in the rejections of Claims

1-5, supra.

16. Claims 26-31, which teaches a set of method claims, fail to teach or define above or beyond the

apparatus found within Claims 1-5 above and are rejected for the same reasons set forth above in the

£ 14 . . .

rejections of Claims 1-5, supra.

17. Claims 32-42, which also teaches a set of method claims, fail to teach or define above or beyond

the apparatus found within Claims 12-16 above and are rejected for the same reasons set forth above in

the rejections of Claims 12-16, supra.

Art Unit: 2302

Claims 43-53, which teaches a set of computer program product claims, fail to teach or define 18.

above or beyond the apparatus found within Claims 12-16 above and are rejected for the same reasons

set forth above in the rejections of Claims 12-16, supra.

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure: 19.

Heylighen teaches the basics of Internet communication and the addressing means used a.

therein.

20. Any inquiry concerning this communication or earlier communications from the examiner should

be directed to Richard J. Gregson whose telephone number is (703) 305-4392. The examiner can

normally be reached on Monday-Thursday from 8:00 a.m. to 5:30 p.m., as well as on alternate Fridays

during these same hours.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Alyssa

H. Bowler, can be reached on (703) 305-9702. The fax phone number for this Group is (703) 308-5358.

Any inquiry of a general nature or relating to the status of this application or proceeding should

be directed to the Group receptionist whose telephone number is (703) 305-9700.

Gregson, Esq.
